# Implementation Build Prompt

Copy-paste engineering brief | Preserve exact ICP colors, layout and design

Ibadan City Polytechnic, Ibadan | Planning baseline: 24 October 2026

## COPY-PASTE BUILD PROMPT

Use the complete instruction below in your coding environment. It is written to keep implementation small and preserve the existing ICP system untouched.

## 1. Role and objective

Act as a careful senior full-stack engineer and UI engineer. Build an independent project titled Development of a Students' Assignment and Lecture Note Portal System for Ibadan City Polytechnic, Ibadan. The system has admin, lecturer and student roles and only the workflows required to upload/read lecture notes, create/submit assignments and grade/publish assignment feedback. Prioritize simplicity, reliability, speed and fidelity to the existing ICP visual identity.

## 2. Source of truth - existing ICP

Existing Cloudflare app: https://icp-course-portal.pages.dev/ (project icp-course-portal). Existing Supabase project: qazayzyrwuwlendhfald, named ICP Course Registration and Result Processing System. Existing DB has departments, programmes, profiles, user_roles, students, lecturers, courses, programme_courses, academic_sessions, semesters and course_allocations, alongside unrelated registration/result structures. Use read-only inspection of those modules and their frontend equivalents to guide reuse. NEVER modify, drop, migrate, seed, update or redeploy the original system.

Mandatory gating step: Locate or obtain the actual frontend source repository/export for ICP before implementing visuals. If source cannot be accessed, do not improvise colors or claim matching design; report the blocker and implement only a style-ready scaffold until assets are supplied. Never scrape or copy private credentials or data.

## 3. Non-negotiable exact design reproduction

• Reuse exact existing ICP logo, favicon, typeface(s), typography scale, colors (extract real HEX/RGB tokens), background styles, borders, corner radii, shadows, spacing scale, icon library, navigation styles and loading states.

• Reuse the ICP login, password recovery, dashboard shell, sidebar/topbar, page title, cards, forms, button, modal, table and toast patterns exactly where applicable.

• Match desktop and mobile behavior including menu drawer, spacing, cards, button placement and responsive breakpoints; do not redesign or modernize.

• No generic stock illustrations, arbitrary gradients, decorative badges, alternative colors, third-party template skins, or unrelated homepage redesign.

• Document all copied style tokens in design-tokens.md citing source paths. Compare screenshots at 1440px desktop and 390px mobile; list any unresolved differences.

## 4. Selective reuse - not a clone

| Reuse from ICP | Build fresh | Exclude entirely |
|---|---|---|
| Auth and role pattern | Lecture-note file upload/list/download | Course registration workflow |
| Profile and course abstractions | Assignment editor/list/details | Semester result processing |
| Dashboard / navigation design | Submission upload and status | CGPA, transcript, grading engine |
| Course-to-lecturer mappings | Assignment feedback and basic notifications | School fees, attendance, complex LMS |

## 5. Strict functional deliverables

Admin: provision/approve student and lecturer access; manage departments/courses and student-course membership; allocate lecturers; show basic activity counts. Lecturer: view allocated courses; upload/publish/unpublish notes; create and edit assignment with deadline, instructions, maximum score and optional file; view roster/submissions; grade and publish individual feedback. Student: view assigned courses; open/download notes; view published assignments; submit permitted file before deadline; view submission receipt, score and published feedback. Notifications: simple in-app notifications for published note/assignment and feedback; approaching deadlines can be shown via UI-derived status without cron. Do not introduce email, SMS or push in MVP.

## 6. Technical implementation constraints

• Create an independent codebase/repository and a new Supabase project under a user-approved organization; deploy to a separate Cloudflare Pages project. Do not point the new app at ICP production DB.

• If project creation incurs charges, stop and obtain explicit approval before creating the resource. Do not overwrite an existing environment.

• Prefer same frontend stack already present in ICP, copying tested source components, not converting to a new framework without a demonstrable need.

• Create minimal SQL schema: profiles, user_roles, departments, courses, course_memberships, lecturer_allocations, lecture_notes, assignments, submissions, assignment_feedback, notifications. Reuse ICP naming conventions where clear.

• Use Supabase Auth, private Storage for notes/submissions, strict RLS and server/database-enforced authorization and deadlines. No service_role in client bundle.

• Publishable keys and Supabase URL can be environment variables; server-only secrets must be kept out of browser bundles and source control.

• Provide sample data for demonstration only: 1 admin, 2 lecturers, 4 students, 3 courses, 3 lecture notes, 2 assignments, and demo submissions/feedback; use safely created Auth users.

## 7. Workflow specifics

### Lecture notes

Upload: allocated lecturer selects course, enters title/description, attaches PDF/DOCX/PPTX and publishes. Student may access only if course member. Display original file name, size, uploaded date, and a download action. Permit lecturer to unpublish or replace own file; ensure old private objects are handled safely.

### Assignments and submissions

Assignment fields: course_id, title, instructions, attachment optional, due_at (timezone-aware), max_score, status. Student submits a permitted file with optional comment and sees timestamp. Default policy: one active submission, replaceable until due_at; reject late submissions at server/database boundary. Show Not Submitted / Submitted / Closed / Graded states clearly.

### Assessment feedback

Only allocated lecturer may grade course submissions; score between 0 and assignment maximum, feedback text optional, private draft vs published flag. Student can read only own published feedback. This is an assignment grade, not a final-semester result.

## 8. Permissions and security tests

• Anonymous user must never read notes/submissions by storage URL or data API.

• Student A cannot read Student B submission, score, feedback or file even by guessing IDs.

• Student cannot create/publish lecture notes or assignments, nor change role.

• Lecturer A cannot grade lecturer B course unless explicitly allocated.

• Server rejects expired upload even if browser clock has been changed.

• Admin actions require database-enforced admin authorization.

• RLS enabled on all public tables; storage policies match memberships and course allocations.

## 9. Implementation order - do not expand scope

• STEP 1: Inspect existing ICP frontend and produce a compact reuse inventory of file paths, components, exact visual tokens and auth patterns. Do not write new UI first.

• STEP 2: Create new minimal application from selected components. Remove irrelevant menus, routes and code.

• STEP 3: Design and apply minimal Supabase schema, RLS policies and private buckets to the NEW project.

• STEP 4: Implement admin controls; then lecturer notes/assignments; then student access/submission; then feedback.

• STEP 5: Add basic in-app indicators and simple reports. No added integrations.

• STEP 6: Test role isolation and critical happy/error paths; compare screenshots with ICP.

• STEP 7: Deploy to NEW Cloudflare Pages project and verify live scenarios. Provide URLs and concise documentation.

## 10. Deliverables and definition of done

• Working separate website with the three role dashboards.

• Complete source with original ICP visual identity reproduced from inspected source, plus design-tokens.md and reuse-inventory.md.

• SQL migration scripts, RLS policies, private storage policy, seed/demo instructions and .env.example (no secrets).

• README with setup, deploy, rollback and login/testing guidance.

• Role-by-role test evidence and mobile/desktop visual comparison images.

• No change whatsoever to existing ICP Cloudflare Pages site or Supabase project.

• No course registration, semester results, CGPA, fees, attendance, chat, AI, parent portal or other scope creep.

## 11. Execution/reporting instruction

Complete implementation in a clear, sequential workflow. First disclose what existing ICP files/assets were actually inspected and what remains inaccessible. If exact visual source is unavailable, ask only for that source/repo (or screenshots plus stylesheets) and do not claim visual fidelity. Do not assume a reusable component works without testing. At completion, report built features, verified tests, deployed URL, exact limitations, and confirmation that source ICP resources were not altered.
